

Executive Summary

This report presents an analysis of banking customer churn using Power BI. The study investigates customer demographics, financial attributes, and behavioral factors affecting churn.

Objectives

- Understand churn behavior.
- Identify high-risk customer groups.
- Recommend retention strategies.

Methodology

Data Collection

Customer churn dataset containing 10,000 records.

Data Cleaning

- Removed duplicates
- Handled missing values
- Corrected data types
- Created calculated columns

Data Modeling

Relationships established between customer attributes and churn indicators.

Visualization

Interactive Power BI dashboard developed for business stakeholders.

Findings

1. Customers aged 51-60 show the highest churn rate.

This age segment requires targeted retention campaigns.

2. Customers with credit scores between 600-700 form the largest customer base.

This segment contributes significantly to overall churn volume.

3. Germany has the highest number of churned customers.

Special focus should be placed on customer satisfaction and engagement strategies in Germany.

4. Customers owning only one product dominate the customer base.

Cross-selling additional banking products may improve customer retention.

5. Inactive customers show a higher tendency to leave the bank.

Customer engagement initiatives should be prioritized.

Recommendations

Customer Retention Program

Develop loyalty programs for customers aged 50+.

Re-engagement Campaigns

Target inactive customers through personalized offers.

Cross-Selling Strategy

Encourage customers to adopt multiple banking products.

Country-Specific Strategy

Conduct detailed churn analysis for German customers.

Predictive Churn Modeling

Implement machine learning models to identify at-risk customers before churn occurs.

Conclusion

The analysis highlights specific customer segments contributing to churn and provides actionable recommendations for improving customer retention and profitability.
